

Artur Mukhutdinov

Tech Lead / Senior Data Platform Engineer

arturmuxutdinov@gmail.com · github.com/CatOrLeader · t.me/CatOrLeader

Summary

Hands-on technical lead who built the streaming layer of X5 Tech's data platform on Apache Flink and Kubernetes: now **200+ production pipelines** and **approximately 20 TB processed every seven days**. Combine architecture and implementation with team leadership.

Experience

X5 Tech — Tech Lead, Streaming Data Platform

April 2026 – Present

- Lead **four engineers** across streaming, backend, infrastructure and observability; own architecture, priorities, delivery and engineer development. Helped hire a DevOps engineer and a Java backend engineer.
- Extended the existing Bach platform and adapted streaming components to work with it: pipeline configuration, component integration, monitoring and alerting. Shape priorities with platform users and product managers.
- Drive CDC reliability and recovery improvements, including schema-change handling, restart from checkpoints/savepoints, Kubernetes integration and production diagnostics.

X5 Tech — Big Data Software Engineer

June 2024 – March 2026

- Created the streaming foundation: selected Flink, designed Kubernetes deployment and operations across Data Hubs, and built the core tooling. Scaled initial adoption **from 0 to 41 production pipelines**, processing **approximately 13 TB every seven days**.
- Built a high-level abstraction over Flink: engineers launch template-based pipelines by writing YAML configuration. Automated Kubernetes manifest generation, Vault integration and GitLab CI/CD for database and Kafka-to-Iceberg loaders.
- Reduced allocated CPU **from 450 to 250 cores (44%)**. Established repository templates and trunk-based development workflows adopted across Data Hubs.
- Extended internal PostgreSQL Flink CDC loaders with schema evolution and signaling-table support.
- Contributed UUID handling for Apache Amoro's Iceberg compaction and a Flink CDC deployment classpath fix; **both changes merged upstream**.

Innopolis University — Software Developer

June 2023 – December 2023

- Built Java backend components for a room-booking service: a Telegram bot, PostgreSQL integration and Docker deployment.

Technical Skills

Languages: Java, Python, SQL.

Data systems: Apache Flink, Flink CDC, Kafka, Iceberg, Amoro, PostgreSQL, MinIO / S3-compatible storage, Apache NiFi; SAP HANA CDC development.

Platform engineering: Kubernetes, Docker, Helm, GitLab CI/CD, HashiCorp Vault, Grafana, Prometheus, Spring Boot, JUnit, Testcontainers.

Education & Languages

Innopolis University — Informatics and Computer Engineering, 2022–2026, graduated.

Languages: Russian — native; English — B2 (self-assessed).

Availability: Open to engineering and technical leadership roles, remote work, employer-supported relocation, contract and part-time opportunities.
